Abstract

The aim of this paper is to present our vision to upgrade the existing ERATOSTHENES Research Centre (ERC) established within the Cyprus University of Technology (CUT) into a sustainable, viable and autonomous Centre of Excellence (CoE) for Earth Surveillance and Space-Based Monitoring of the Environment (EXCELSIOR), which will provide the highest quality of related services on the National, European and International levels. The implementation of the vision will be addressed through a robust Business Plan that will be developed with in Phase 1 of EXCELSIOR project and will establish the foundations for the development of a competitive and high competence profile to expand the Centre’s visibility beyond the national level and develop transnational regional cooperation. The Business Plan is key to ensure the sustainability of the CoE and will also provide the necessary guarantees for a self-sustained operation. The long term aim of the upgraded Centre is to create new opportunities for conducting basic and applied research and innovation (R&I) in the areas of the integrated use of remote sensing and space-based techniques for monitoring the environment.

Keywords: Center of Excellence, remote sensing, Cyprus, environmental monitoring

1. Introduction

Earth Observation technologies are vital for providing reliable up-to-date information to better observe, understand, protect, monitor and predict environmental parameters that regard land, water and air. Such valuable inputs are crucial for more informed decision-making oriented towards the protection and management of environment and resources. Earth observation utilizes technological solutions including satellite observation, navigation and positioning systems. To date, conventional methods are employed for the detection of threats/risks related to pollution events in air, land and water, including the use of physicochemical sampling campaigns and site visits. These techniques are time consuming and require extensive use of manpower and, the same time, create additional environmental issues. The existing ERATOSTHENES Research Center (ERC) conducts state-of-the-art research, integrating novel technologies in the areas of Remote Sensing and space-based earth observation techniques, along with the use of Geographic Information Systems (GIS), to develop sustainable and systematic monitoring of areas of interest and the on-time detection of risks. The ultimate goal of the CoE will be the protection of the environment, providing critical information, through end user products; not only to policy makers but also to other local, national and regional authorities. The ERC has demonstrated its innovation and dynamics in the field of Earth Observation over the past 10 years of its existence and is now focused on upgrading the existing ERC into a Center of Excellence (CoE), which will address the national, regional and international needs regarding remote sensing and Earth Observation. The ERC has received funding for over 60 competitive research programs and funded projects since 2007, with funding Sources from the European Union (EU), the Cyprus Research Promotion Foundation (RPF) and industry. The recent projects of ERC are focused on the Remote sensing applications in the fields of i) Environmental and Climate Research (EU- FP7: BACCHUS, EU-H2020: GEOCRADLE, RPF: AIRSPACE, RPF: WEBAIR) ii) build environment protection and monitoring (RPF-JPI: PROTHEGO, RPF-JPI: CLIMA, RPF: ICAROS) iii) agricultural and ecosystems (EU-FP7: CASCADE iv) water management and resources (RPF: WATERLEAKS, HYDRAULICS) and v) innovation and efficiency in built environment (RPF: STEELCOR, EU-FP7: ANAGENISIS, and INTEREG: MARITIME SPATIAL PLANNING and v) training and transfer of knowledge EU-H2020: ATHENA and EU-ERASMUS+: ITRAPRISE.
The current state-of-the-art focuses on water management as one of the more important priority sectors for Cyprus, since the island has a long history of water challenges, including severe water scarcity problems for centuries. The ERC aims to support public authorities, stakeholders and private interest to retrieve useful information for optimizing water management by using available satellite data. Some of the major research sectors of the Centre, monitoring water quality in dams using satellite remote sensing, with the aim to protect and preserve the quality of available water as well as monitoring coastal areas, and identifying water leakages in urban and rural areas through passive and active remote sensing techniques (Agapiou et al., 2014; 2016). Additional research includes examining drought events due to climate change through earth observation systems as well as Marine Spatial Planning (Hadjimitsis et al., 2015), which focuses on coastal and maritime tourism and the promotion of sea based cargo and passenger transportation are some of the crucial areas included.

2.3. Atmospheric Section

The current state-of-the-art of the Atmospheric sector of ERC are primarily focused on (1) provision of useful tools and knowledge for the discrimination of manmade from natural sources of pollution, for subtracting the contribution of natural sources before comparing ambient air pollutant concentrations with relevant legally binding limit values (Nisantzi et al., 2014; Nisantzi et al., 2015; Mamouri and Ansmann, 2014), (2) minimization of agricultural losses and efficient planning through better understanding of precipitation and hail initiating processes, since the on-line knowledge of the background aerosol content in terms of freezing nuclei can provide a valuable source of information for future rainfall enhancement and/or hail suppression operations (Mamouri and Ansmann 2015; 2016), and (3) alert mechanisms for high aerosol concentrations (e.g., dust events, volcanic eruptions), for enabling timely information of the public, minimize exposure and reduce hospital admission and other health related costs (health, tourism) (Hadjimitsis et al., 2013a; 2013b; 2013c; Mamouri et al., 2016) and to improve safety in aviation (transport).

3. Smart Specialization Strategy (S3Cy)

The EXCELSIOR’s project vision of the significant upgrade of the ERC into a CoE in Earth Surveillance and Space-Based Monitoring of the Environment, is fully aligned with the Smart Specialization Strategy (S3Cy) for Cyprus. The S3Cy has been established by the Government of Cyprus (Government of Cyprus, 2015), based on priority sectors that have been selected for future sustainable economic growth in Cyprus. The strong background and individual experience of the ERC in the area of remote sensing and space technologies, combined with the synergy that will be established with the partners of the project, can result in the implementatin of a sustainable CoE, which will address crucial research and innovation (R&I) problems of great societal benefit. The research fields of Earth Observations and space technology have matured to the point that many challenges lie in the capitalisation of existing knowledge and...
technologies to enable advances in many diverse application areas stated in the S3Cy, such as health, tourism, agriculture, cultural heritage, transport, blue growth etc. The R&I activities of the upgraded ERATOSTHENES CoE are planned to be directly linked with the thematic areas of the horizontal priorities of Environment and Information & Communication Technologies of S3Cy, through future collaboration with the industry.

4. Conclusions

The objective of the first phase of the EXCELSIOR project is the development of a detailed and robust Business Plan for upgrading the ERC. Such a Business Plan will target the long term vision to transform ERATOSTHENES itself into an EXcellence Research Centre for Earth Surveillance and Space-Based Monitoring Of the Environment by enhancing the scientific and R&I capabilities of the existing center. This enhancement will enable the provision of new, highly innovative products and services to national, regional and international public and private sector, in the Space and Earth Monitoring sectors. The development of the Business Plan is key to ensure the sustainability of the CoE and will also provide the necessary guarantees for its long term self-sustained operations. The Business Plan will establish the foundations for the development of a competitive and high efficiency profile to expand the Centre’s visibility beyond the national level and develop transnational regional cooperation.
